12:42 PM

Checking the host toolchain first, then building the full codebase.

```
which brew && brew --version 2>/dev/null; which aarch64-linux-gnu-gcc 2>/dev/null || echo "NO cross-gcc"; which  
qemu-system-aarch64 2>/dev/null || echo "NO qemu-aarch64"; which git && git --version
```

```
/opt/homebrew/bin/brew
```

```
Homebrew 4.6.7
```

```
aarch64-linux-gnu-gcc not found
```

```
NO cross-gcc
```

```
qemu-system-aarch64 not found
```

```
NO qemu-aarch64
```

```
/usr/bin/git
```

```
git version 2.50.1 (Apple Git-155)
```

```
mkdir -p
```

```
/Users/apple/agentos/{hac/{core,mmio,primitives,ipc,inference,monitor,security},kernel/{drivers,dts},supervisor/{core,  
ui,compiler,runtime},scripts,docs} && git -C /Users/apple/agentos init && echo "done"
```

```
Initialized empty Git repository in /Users/apple/agentos/.git/
```

```
done
```

Completed Check host toolchain & install deps (brew, cross-gcc, QEMU) (1/20), Scaffold repo & directory structure (2/20)

Now writing the HAC EL2 core — starting with the EL3 monitor, then EL2 entry.

Now writing the HAC C sources — main init, memory allocator, SMMU, and MMIO maps in parallel.

Writing UART, SMMU, primitives, IPC, security, and inference in parallel batches.

Writing IPC ring buffer, capability model, and inference stub simultaneously.
